BSV Blockchain Track

TUM Blockchain & AI Hackathon 2026

Partner Track Requirements · BSV Association

October 2026

BSV Association Track Information

Track information from BSV Association for the TUM Blockchain & AI Hackathon, 30–31 October 2026, House of Communication, Munich, in response to TUM Blockchain Club's Partner Track Requirements.

1. Company and track description

Company description

BSV Association is a non-profit organisation based in Zug, Switzerland, and the global advocate for the BSV Blockchain. We support developers, enterprises and public-sector institutions through technical education, open-source developer tools and real-world use cases. The BSV Blockchain is a scalable public blockchain built for high transaction volumes at very low cost, which makes it well suited to micropayments and data-integrity applications.

Track name

BSV Blockchain Track – DeFi Rails for Agentic Payments

Track description

AI agents are starting to buy services, call APIs and pay for data on their own. To do this at scale, every agent needs three things at once: identity, micropayments and traceability. Blockchain is the only technology that provides all three together, and BSV Blockchain's very low fees make pay-per-use micropayments viable at the volume agents generate.

What agents still lack is the financial layer: stable value to pay with, liquidity, and ways to swap and move funds between chains. In this track, build that **DeFi layer on BSV Blockchain**, then show an AI agent using it to make a real payment. The DeFi product is the core of your project; the agent can be simple, for example one that swaps into the right token and pays for an API call.

Example ideas (examples, not limits):

- Non-custodial bridges that bring stablecoins such as USDT or USDC onto BSV Blockchain, for example using ICP's chain-key technology
- An order-book DEX or token swap where people and agents trade bridged assets on BSV Blockchain
- A launchpad where projects or agent-powered services raise funds in bridged stablecoins
- Cross-chain flows that bring users and liquidity from other chains into BSV Blockchain applications
- Any other DeFi idea that gives people and agents a real reason to use BSV Blockchain

Website, social and logo

- Website: https://bsvassociation.org
- X: @BSVAssociation

- Logo: the BSV Association logos (SVG, PNG, JPG, PDF and AI; RGB, CMYK and mono versions) and the logo usage guidelines are in **BSVA Logo Guidance.zip**, included in the developer pack

2. Prize distribution

Place	Prize
1st place	€2,500
2nd place	€1,000
3rd place	€500
Total prize pool	**€4,000**

Payout format: [to be confirmed]

3. Qualification requirements

What teams must build or integrate

- Build on BSV Blockchain with BSV Association's open-source stack: the BSV TypeScript SDK (github.com/bsv-blockchain/ts-sdk) and, where wallet functionality is needed, the Wallet Toolbox (github.com/bsv-blockchain/wallet-toolbox).
- Connect user-facing flows to BSV wallets such as BSV Desktop or BSV Browser, so people can use the app with a standard BSV wallet.
- Make real transactions on BSV Blockchain (testnet or mainnet).
- Keep user funds non-custodial wherever funds are involved, with no single party holding users' assets.
- Include at least one AI agent that uses the project to make a payment. A simple agent is enough.

What the demo and submission must include

- Open-source repository with a README explaining what the project does and how to run it.
- A live demo, or a short demo video (2–3 minutes) showing the project working end to end, including the agent payment.
- Links to example transactions on BSV Blockchain (for example on WhatsOnChain).
- A short usage and value note (one page or a README section): what problem the project solves, who the target users are, how people would use it, and what value it brings to BSV Blockchain, for example new users or liquidity from other chains.

How we will judge

What we value most

- Adoption: an app people would actually come to BSV Blockchain to use because it is useful and stands out, ideally bringing new users or liquidity from other chains. Working code alone is not enough.
- Real use of the BSV stack: the SDK, the Wallet Toolbox and BSV wallets, with real on-chain transactions.

Criterion	Weight
Adoption potential and real-world usefulness	35%
Use of the BSV Blockchain stack (SDK, Wallet Toolbox, BSV wallets)	25%
Technical execution, including a sound non-custodial design	20%
Agentic payments: the agent uses the project in a real payment flow	10%
Originality and presentation	10%

4. Developer resources

BSV Association shares a developer resource pack as a ZIP file, **BSV-TBC26-Developer-Pack.zip**. Teams should open START-HERE.md first. The pack is designed so that an AI coding assistant can build directly from it.

What is in the ZIP

File	What it is for
START-HERE.md	Read first: setup, getting satoshis and contact.
BSV_STACK_COMPLETE_GUIDE.md	Complete, tested guide to the BSV Blockchain stack; the context file for AI assistants.
AGENTS.md	Rules and package versions for AI coding agents.

File	What it is for
starter/bsv21-token-kit/	Working starter project: tokens, NFTs, payments, paid APIs and a web UI (38 tests).
BSVA Logo Guidance.zip	BSV Association logos and the logo usage guidelines.
TBC26_BSV_Track_Requirements.pdf	This document.

Documentation, SDK, wallets and repositories

- Wallets: BSV Desktop at desktop.bsvb.tech, and BSV Browser for mobile at mobile.bsvb.tech
- BSV TypeScript stack (SDK, Wallet Toolbox, overlays, payment and auth middleware): github.com/bsv-blockchain/ts-stack
- Arcade (broadcasting, transaction status and block headers for SPV, no API key needed): arcade-v2-us-1.bsvblockchain.tech
- BRC standards: github.com/bsv-blockchain/BRCs
- Starter template: starter/bsv21-token-kit in the ZIP, with its full source also in Appendix A of the guide

MCP servers, agent skills and AI tooling

- BSV_STACK_COMPLETE_GUIDE.md as the single context file for AI assistants, plus AGENTS.md
- bOpen plugins for Claude Code: bsv-skills (BRC-100 wallet, key derivation, standards), 1sat (BSV-21 tokens, ordinals, marketplace, payments) and bsv-mcp (MCP server). These are community tools, not maintained by BSV Association: bopen.ai/agents

API keys and credits

No API keys are needed. BSV Association provides mainnet satoshis to every team: in BSV Desktop, go to Payments → Receive → BSV Address, copy the address and send it with your team name to **@lexamaison** on Telegram.

Example projects and support

The starter kit is the reference example project. For questions about the stack, the starter kit or the track, contact **@lexamaison** on Telegram.
